ADNSU CAREER CENTER

PRODUCTION SYSTEM DOCUMENTATION

Connected career ecosystem

Student, Company and Admin on one secure platform

System overview, user flows, subscription packages, approval workflow, database architecture, security, deployment and maintenance.

MAIN PLATFORM	https://asoiu-career.vercel.app/
ADMIN PANEL	https://asoiu-career-admin.vercel.app/
DOCUMENT VERSION	Production upgrade - October 2026

01 / OVERVIEW

Project overview

A single career platform that preserves the existing ADNSU interface while connecting all roles to one backend and one source of truth.

Primary objective

The platform turns the complete recruitment journey into one controlled workflow: a student creates a reusable education profile, a company chooses a subscription plan, an approved company submits a vacancy, an administrator reviews it, and only approved content becomes visible to students.

One backend	Both the main website and Admin Panel use the same Supabase Auth, PostgreSQL database, Row Level Security policies and Edge Functions.
Existing UI preserved	The canonical ADNSU portal shell, navigation structure and visual identity remain in place. Working modules are extended progressively.
Real controls	Package limits, visibility and role permissions are enforced by the backend. They are not presentation-only restrictions.

Core outcomes

- Separate Student and Company registration flows.
- Bachelor and Master education records stored without overwriting each other.
- Configurable Free, Pro and Business entitlements.
- Vacancy approval queue connected to public publishing.
- Admin CRUD, moderation, audit logs and guarded reset controls.
- Responsive desktop, laptop, tablet and mobile interfaces.

02 / ARCHITECTURE

System architecture

The solution uses two user interfaces and one shared data and security layer.

MAIN WEBSITE	SUPABASE	ADMIN PANEL
Student and Company portal	Auth + PostgreSQL + RLS + Edge Functions	Career Center operations

Responsibilities

Main website	Registration, profile, vacancies, applications, companies, events, network, CV tools, interview preparation, notifications and company dashboard.
Supabase	Identity, shared relational data, foreign keys, row policies, configurable limits, workflow triggers, notifications, audit events and server-side AI access.
Admin panel	Student and company management, approval queues, plans, subscriptions, payments, moderation, AI usage, notifications, reports and admin users.

Production boundaries

- Only the publishable key is available to browsers.
- Service Role access is restricted to server-side Edge Functions.
- Anonymous users can read only approved or published opportunities.
- Application decisions remain controlled by the owning company and authorized staff.

03 / STUDENT

Student journey

Students, Master students and alumni share one account model with reusable education records.

Choose Student -> Create account -> Add education -> Discover -> Apply -> Track status

Registration data

AREA	FIELDS
Core	First name, last name, email, password, phone and optional profile image
Bachelor	University, faculty, specialty, course, group, start year and end year
Master	Master university, faculty, specialty, specialization, group, start year and end year
Level	Bachelor, Master, Graduate / Alumni

Student capabilities

- Advanced vacancy filters by keyword, company, faculty, specialty, skills, work type, city, work mode, salary, deadline and experience.
- Applications, saved opportunities, notifications and career recommendations.
- Network posts, images, PDF documents, projects, certificates, questions and collaboration requests.
- CV builder and server-side AI analysis with no invented experience.
- Dynamic interview preparation by specialty, role, company and interview type.

Privacy rule — A company does not automatically see every student. A Free company sees its own applicants; wider candidate search requires an enabled paid-plan feature.

04 / COMPANY

Company journey

Company onboarding combines verified business details, plan selection, approval and controlled vacancy publishing.

Choose Company -> Business profile -> Select plan -> Admin review -> Create vacancy -> Manage applicants

Company registration

- Company name, corporate email, password, phone, website and industry.
- Company size, address, logo and short description.
- Contact person name, position, email and phone.
- Initial package selection: FREE, PRO or BUSINESS.

Company dashboard

Active vacancies	**Total applications**	**New applications**	**Profile views**
Vacancy views	**Shortlisted**	**Interviews**	**Hires**

Applicant pipeline

Applied -> Review -> Shortlist -> Interview -> Offer -> Hired

Every stage update is recorded in application status history and can create a student notification. Students cannot alter company decisions.

05 / SUBSCRIPTIONS

Subscription packages

Exactly three main company plans are available. Limits are editable by administrators and enforced by the database.

PLAN	PRICE	VACANCIES	FEATURED	KEY VALUE
FREE	**0 AZN / month**	**1 active**	**0**	Profile, basic applicant list, dashboard, basic analytics, limited text posts
PRO	**24.99 AZN / month**	**Up to 10**	**2 / month**	Candidate search, Talent Pool, AI matching, media posts, advanced analytics
BUSINESS	**49.99 AZN / month**	**Unlimited**	**10 / month**	Advanced database, priority placement, team recruiters, campaigns, bulk messaging

Backend enforcement

Configurable features	Plans, feature keys, numeric limits, subscription state and usage counters live in separate relational tables.
Vacancy protection	A trigger blocks a company from exceeding its active vacancy allowance, including requests sent outside the UI.
Content and team protection	Monthly company post limits, media rights and team member counts are verified before data is inserted.
Candidate protection	Candidate search and AI ranking rights are granted by active subscription features, not by client-side labels.

06 / APPROVAL

Vacancy approval workflow

Every company-created opportunity enters a controlled review queue before public distribution.

Draft -> Pending approval -> Admin review -> Approved / Published -> Visible to students

Vacancy content

- Title, company, type, department, description and responsibilities.
- Requirements, required skills, preferred skills, target faculty and specialties.
- Experience level, salary range, currency, visibility, city and work mode.
- Deadline, number of positions, application method and application URL.

Admin decisions

Approved / Published	Visible on the main website and available for applications.
Changes Requested	Returned to the company for correction.
Rejected	Kept out of public results.
Expired / Archived	Removed from public discovery while retaining history.

Only approved or published records pass the anonymous and student-facing database policies. Deleting or archiving a vacancy in Admin takes effect on the main platform immediately because both applications read the same row.

07 / ADMINISTRATION

Admin operations

The Career Center receives one operational view across users, companies, vacancies, subscriptions, content and system activity.

Navigation and control areas

Dashboard	**Students**	**Master students**	**Graduates**
Companies	**Vacancies**	**Pending approvals**	**Applications**
Network	**Posts**	**Events**	**Plans**
Subscriptions	**Payments**	**CV system**	**Interview system**
AI usage	**Notifications**	**Reports**	**Settings**
Admin users	**Audit logs**	**Moderation**	**System reset**

Administrative safeguards

- Maximum five active admin accounts.
- Admin creation, update and deletion handled by a verified server-side function.
- Super Admin reset requires two-step confirmation and exact confirmation text.
- Reset preserves administrator accounts, plans and academic lookup data.
- Important actions store actor, action, entity, entity ID, timestamp, old value and new value.

Operational principle	Administrators can add, edit, suspend, verify, archive and delete records within their permissions. Private company hiring decisions remain company-controlled unless a documented policy requires intervention.

08 / DATA

Database architecture

A relational schema keeps identity, education, subscriptions, recruitment, content and governance connected by foreign keys.

DOMAIN	TABLES
Identity	users / auth.users, profiles, education
Company	companies, company_members
Commercial	plans, plan_features, subscriptions, subscription_usage, payments
Recruitment	jobs, job_skills, applications, application_status_history
Community	posts, post_media, comments, likes, follows, saved_items
Operations	events, notifications, reports, moderation_logs, audit_logs
Career tools	cv_documents, interview_sessions, ai_usage

Data lifecycle

- Schema changes are versioned as SQL migrations.
- Foreign keys prevent orphaned relationships.
- Usage counters support plan dashboards and enforcement.
- Status history preserves recruitment decisions over time.
- Notifications connect database workflow changes to user-facing updates.

09 / SECURITY AND AI

Security and intelligent tools

Authentication, authorization and AI calls are separated so that public clients never receive privileged credentials.

Security controls

- Supabase Auth manages production credentials and sessions.
- Role-based route protection covers student, company, staff, admin and super admin contexts.
- RLS checks user ID, ownership, active status and plan features on each protected query.
- Service Role secrets stay inside managed server runtimes.
- Audit and moderation logs support accountability.
- No payment key, OAuth secret, database password or private key belongs in Git.

AI capabilities

CV tools	Analyze ATS readability, clarity, measurable impact and keywords. Rewrites preserve facts and never invent experience.
Interview preparation	Generate dynamic behavioral and technical questions from specialty, role, company and interview type.
Matching explanation	Explain deterministic vacancy matching without using sensitive attributes to rank candidates.
Provider controls	Gemini is the primary supported free-tier option; Groq is available as a fallback. Keys are Edge Function secrets and usage is logged.

If no provider key is configured, the platform returns a clear configuration error instead of fabricated AI output.

10 / DEPLOYMENT

Deployment and maintenance

The existing production domains remain authoritative and must be deployed from the correct roots.

Vercel project	Root	Production domain
asoiu-career	**student-web**	**asoiu-career.vercel.app**
asoiu-career-admin	**repository root**	**asoiu-career-admin.vercel.app**

Release order

Database migrations -> **Edge Functions** -> **Main portal** -> **Admin panel** -> **Smoke tests**

Maintenance checklist

- Run TypeScript typecheck and production build before deployment.
- Test RLS visibility, package limits and vacancy approval on each release.
- Keep GitHub repository private and review staged files for secrets.
- Verify backups before any production reset.
- Rotate external API secrets and review AI usage and audit logs.
- Run desktop and mobile smoke tests on both production domains.

11 / VERIFICATION

Delivery and test checklist

The release combines automated checks, database policy tests and end-to-end acceptance tests.

STATE	CHECK
PASS	Admin TypeScript and production build
PASS	Main portal JavaScript syntax
PASS	Student / Company registration chooser
PASS	Master education fields and separate record model
PASS	FREE 1-vacancy backend limit
PASS	Anonymous job visibility policy
PASS	FREE candidate database restriction
PASS	Pending approval and publish workflow
PASS	Desktop and mobile registration layout
READY	AI function - provider secret required for live generation
READY	Payment adapter - provider selection required for automatic checkout

Acceptance scenario

Create one student and one company. Select a package, approve the company, submit a vacancy, confirm it is hidden, approve the vacancy, confirm it appears on the main site, submit a student application, move it through the company pipeline, and verify notifications plus audit history. This scenario validates the complete connected ecosystem.

ADNSU Career Center

One platform. Shared data. Controlled publishing.
